

école 

THE PROBLEM

Fine-tuning is still unreasonably hard.

- Building training datasets from your own documents requires custom pipelines and manual labor. Teams spend weeks on data preparation alone.
- Setting up GPU infrastructure, configuring training runs, and managing hyperparameters demands deep ML expertise. Most teams don't have it.
- Evaluating whether your fine-tuned model actually outperforms the base model is ad-hoc and inconsistent. No standardized benchmarking.
- Deploying and distributing models across your organization involves yet another set of tools. Fragmented workflows slow everything down.

THE SOLUTION

One platform. Upload to deploy.

1

unified platform replaces a fragmented stack of tools, scripts, and notebooks

0

ML expertise required — upload your documents and ecole handles the rest

∞

models you can train, evaluate, and push to HuggingFace Hub from one place

ecole automates dataset generation, GPU training, benchmarking, and model distribution — so your team can focus on the problem, not the plumbing.

STEP 1

01 Upload your documents.

Create a project, define your model's purpose, and drop in your PDFs or text files. ecole handles ingestion and chunking automatically.

STEP 2

02

Generate a training dataset.

AI-powered extraction creates high-quality question-answer pairs from your source material. Review, filter, and refine before training.

STEP 3

03 Train your model.

Pick a base model, choose your GPU hardware, and launch training on HuggingFace Jobs. Your fine-tuned model is pushed to the Hub automatically.

STEP 4

04 Evaluate the results.

Compare your fine-tuned model against the base and teacher models with automated benchmarks. See exactly where your model improved.
